

SolSplit

On-chain bill splitting and group payments that settle instantly in stablecoins

The Problem & Our Solution

Splitting group expenses today means manual IOUs, spreadsheets, and apps that don't work across borders or currencies.

- Apps like Venmo or Splitwise require manual settlement and don't support global, bank-free payments.
- Cross-border groups struggle with currency conversion and slow, costly bank transfers.
- SolSplit nets all debts in a group automatically and settles everyone in USDC on Solana.
- No bank account needed, works globally, and Solana's low fees make small debts worth settling.

How It Works

A Solana program tracks group expenses, nets balances, and settles everyone in USDC through a single, simple flow.

- User flow: create a group, add a bill with a photo receipt, invite friends via QR code.
- The app calculates who owes whom and runs a netting algorithm to minimize transactions.
- On-chain: an Anchor program on Solana stores group and expense state and executes USDC transfers.
- One-click settle sends the minimum number of USDC payments via Solana Pay and Phantom wallet.
- A dashboard shows expense history and live balances per group, updated after each settlement.

Solana, Anchor, Rust, React, Solana Pay, USDC, Phantom Wallet Adapter

Why Now & What's Next

Stablecoins are going mainstream and Solana's low fees finally make friend-to-friend micro-settlements practical.

- USDC adoption plus Solana's low fees make settling small shared debts economically viable.
- Next: multi-currency support with on-chain FX via Jupiter for international groups.
- Next: a mobile app with push notifications for pending debts and settlements.
- Next: partnerships with travel and expense-tracking apps for direct integration.
